Resources and AI Reflection

TSA High School Webmaster · Glassbox: An AI Field Guide for Students · Team ID: [Team ID]

1. RESOURCES USED

Resource	Type	How it was used
Claude (Anthropic)	Generative AI assistant	Planning, organizing documentation and the work log, suggesting types of sources, and helping write and debug HTML/CSS/JavaScript
Trello	Project management (not generative AI)	Used like a Gantt chart: a timeline of every task with its owner, how to do it, and its due date
W3Schools	Free coding tutorials	Learning HTML, CSS and JavaScript while building the site
MDN Web Docs	Technical reference	HTML, CSS, Canvas API and localStorage documentation
W3C WCAG 2.2	Accessibility standard	Contrast, keyboard access and alt-text decisions
Google Fonts	Font hosting (SIL Open Font License)	Newsreader, Public Sans and IBM Plex Mono typefaces
GitHub / GitHub Pages	Version control and hosting	Storing code and publishing the site 24/7
Research sources (19)	Government, academic and official sources	Lesson facts and statistics; full APA list on the site's References page

2. WAS AI USED? WHERE AND HOW?

Yes. Our team used generative AI as a **tool** to help us document, track and research our work, and to assist with parts of the code. It did not replace our decisions, research or review. Specifically:

- **Learning to code and learning about AI.** Our programmers (WW, EH) used AI alongside W3Schools to learn HTML, CSS and JavaScript, asking it to explain concepts and error messages. The whole team also used it to understand what AI is and how it works, which is the topic of our site.
- **Turning the rules into a plan.** We gave the AI the TSA design brief and rating form and asked it to make a requirements checklist. We turned each item into a task on our Trello timeline and assigned an owner.
- **Documenting our work log.** After each meeting, we gave the AI our rough notes and asked it to sort them into work-log entries (task, owner, reviewer, status). A team member checked every entry against what actually happened before it went into Trello and onto our About page.

- **Tracking who did what.** The AI helped us plan how to set up Trello like a Gantt chart, so every task had one owner, steps and a due date. This kept our two programmers (WW, EH) and two designers/outliners (TC, LK) on the same schedule.
- **Finding resources.** We asked the AI what kinds of credible sources exist for each topic (government frameworks, peer-reviewed studies, official style guides). We found, opened and read every source ourselves before citing it. Several AI-suggested links were outdated or broken, and we replaced them with working originals.
- **Writing and debugging code.** The AI helped draft and debug parts of the HTML, CSS and JavaScript, such as the progress tracker and quiz logic. Team members reviewed, tested and edited the code, and we can explain how each part works.

Things we did **without** AI: choosing the concept and name, the three-module structure and the gamification design. TC and LK designed the layout and look, outlined the content, and changed colors and styles directly in the code. We also made the final wording decisions and did all fact checking and browser and device testing ourselves.

3. EFFECTIVENESS

AI was most effective for **organization and speed**. It turned scattered meeting notes into a consistent work log, helped us break the rubric into trackable tasks, and caught code errors quickly. That gave us more time for testing and polishing.

It was **least reliable for facts**. It sometimes stated dates or details incorrectly and suggested links that no longer worked. Those experiences directly inspired our “Spot the hallucination” lab in Module 2. They also confirmed our rule that a human verifies every fact.

4. ETHICAL CONSIDERATIONS

- **Transparency:** We disclose all AI use on our References page and in this form, following TSA's Use of Generative AI guidelines.
- **Accuracy:** No AI-provided fact, statistic or source was published without a team member checking the original.
- **Privacy:** We did not enter personal information about students or teachers into any AI tool. The website collects no personal data; progress is stored only in the visitor's own browser.
- **Originality and copyright:** We used no AI-generated images. All graphics are original SVG artwork, and all fonts are openly licensed.
- **Learning:** We treated AI the way our site teaches students to: as a helper for organizing and checking work, not a replacement for understanding it.

5. WHAT WE LEARNED

Using AI responsibly took planning: clear prompts, a rule that every output gets a human check, and honest records of where AI helped. Building a site about responsible AI while using AI responsibly made the lessons on our site feel real to us. They are lessons we can now explain from experience.

Team members (initials): WW and EH (programmers), TC and LK (design and content outlining)
